

MINIMIZE YOUR PCWP MACT IMPACT

ENVIRONMENTAL PERMITTING

Is Your Facility Low Risk Under MACT?

Evergreen Engineering can help your mill determine the best strategy for complying with your obligations under PCWP MACT. Every site is unique and offers different opportunities for obtaining the desirable low risk designation. The probability is high that you can qualify for low risk de-listing.

Evergreen offers an economical step-by-step program to determine your mill's individual status *before* you make commitments for expensive testing and possibly unnecessary emission control equipment. Our approach draws on our deep well of process experience to understand operational variables and our experience in testing, modeling, and analysis.

Evergreen will visit your facility, develop and/or confirm emission inventory estimates, perform a status check of your situation relative to MACT compliance, evaluate the potential benefits of the various compliance options, and recommend a path forward.

If additional emission control technology is required, Evergreen Engineering is an industry leader in providing both detailed engineering for integrating the new equipment into existing mills, and the associated environmental permitting services.

The timetable for filing low-risk applications is short, so the time to start is now. Evergreen has tools to help you through this process quickly and cost-effectively.
